The invention relates to a novel isolated nucleic acid and the PRO polypeptide encoded by it. A protein of the invention has polypeptide encoded by it. A protein of the invention has antidiabletic, dermatological, antipsoriatic, antidiabletic, dermatological, phones to propertide is useful for treating an immune related disorder such as agonist, antagonist, or antibody that specifically binds to the agonist, antidiamly related an immune related disorder such as pystemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, or systemic sclerosis, andiopathic inflammatory myopathy, Sjogren's syndrome, systemic sclerosis, antidimmatory myopathy, Sjogren's syndrome, thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal crossorial interval and polymeuropathy, Guillain-Barre syndrome, system, idiopathic demyelinating polymeuropathy, Guillain-Barre syndrome, system, idiopathic demyelinating polymeuropathy, Guillain-Barre syndrome, confisease, infectious or autoimmune chronic active hepatitis, primary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel disease, gluten-sensitive enteropathy, Mulple's clisease, asthma, allergic rhinitis, atopic dermatitis, food disease, asthma, allergic rhinitis, atopic dermatitis, protein or pneumonitis, a transplantation associated disease, graft rejection or consumption or immunologicalisease, draft rejection or consumptions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New PRO polypeptides and polynucleotides, useful for treating e.g. erythematosus, rheumatoid arthritis, diabetes mellitus, immune-mediated renal disease, or demyelinating diseases of the central or peripheral

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel polynucleotide and polypeptide sequence for the antigen detected by the antibody MCA 44-3A6. This antigen is designated Labyrinhin (lab). Antibodies directed to the Labyrinhin (lab) accepted to the Labyrinhin (lab) antibodies directed to the Labyrinhin (lab) brotein are useful for the detection of Lab. The Lab protein is amount of antibodies (this method is especially useful for accer and that have the Lab marker). As the Lab gene is not tissue-specific, it will detect cancer regardless of which organ it occurs in. Peptides cancers and/or to treat humans with cancer. Antibody MCA 44-1A6 is able to differentiate antigens associated with adenocarcinomas. However, the cancers and/or to treat humans with cancer. Antibody MCA 44-1A6 is able to differentiate antigens associated with adenocarcinomas. However, the cancer control of the antigen detected by this antibody as not been elucidated sequence of this antigen would enhance its usefulness in cancer diagnosis, treatment and prevention. The present invention discloses the sequences of the antigen recognized by the MCA 44-3A6 antibody. This sequence of the antigen recognized by the MCA 44-3A6 antibody. This sequence of the antigen recognized by the MCA 44-3A6 antibody. This sequence of the antigen recognized by the MCA 44-3A6 antibody. This sequence of the antigen recognized by the MCA 44-3A6 antibody. This sequence of the numan lab protein described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            604
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         664
                                                                                                             The invention describes an isolated polynuclectide and polypeptide useful for stimulating and/or expanding T cells specific for a tumour protein for determining the presence of a cancer in a patient. A composition containing the polynuclectide and/or polypeptide is useful for treating a lung cancer in a patient. The polypeptide is useful for removing tumour cells from a biological sample. The polynuclectide is useful for removing tumour probe or primer to detect the level of mRNA encoding a tumour protein. This sequence encodes a lung tumour associated protein or protein. Fragment, described in the method of the invention. Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to a polynucleotide encoding a lung tumour protein, comprising a sequence selected from any of the 14 sequences mentioned in comprising a sequence selected from any of the 14 sequences mentioned in specification, or a sequence (S2) mentioned in specification, complement of S1, sequences to S1, sequences to complement of S1, sequences that hybridise to S1, sequences having 75%, preferably of S1, sequences that hybridise to S1, sequence from any one of isolated polypeptide (comprising a sequence (S1) selected from any one of isolated polypeptide (comprising a sequence shaving at least 70%, concerned by the polynucleotide, or sequences having at least 70%, conferably 90% identity to a sequence encoded by the polynucleotide, and sequence compression control sequence, a host cell transformed or transfected with expression control sequence, a host cell transformed or transfected with the vector, an isolated antibody (or its antigen-binding fragment) that the vector, a final prince to the polypeptide, detecting the presence of a cancer conficically binds to the polypeptide, detecting the presence of a cancer in a patient, a fusion protein comprising the polypeptide, an oligonucleotide that hybridises to S1 under moderately stringent conditions, stimulating and/or expanding T cells specific for a tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel lung cancer polynucleotide encoding lung cancer protein, useful for detecting the presence of lung cancer in a patient, and in pharmaceutical compositions, e.g. vaccines, for treating lung cancer.
                                                                                                                                                                                                                                    784

correcting comparising contacting T cells with the polynuclectide, protein correcting cells, under conditions and for a time sufficient content and the standard content of T cells) and inhibiting the development of a cancer in a patient (by incubating CD4+ and/or CD8+ T cells isolated from a patient with the polynuclectide, protein or antigen presenting cells that express the polynuclectide, such that T cells presenting cells, and thus inhibiting the development of the conformation of a cancer in the patient. The polynuclectide, protein and scills are useful in a composition for stimulating an immune response in a patient, and for composition for stimulating an immune response in a patient, and for compositions are useful in paramacentical compositions, e.g. vaccines. The polynuclectide are useful in paramacentical compositions, e.g. vaccines. The polynuclectide is also useful as a probe or patient. The protein and oligonuclectides are useful in pharmacentical compositions, e.g. vaccines. The polynuclectide is also useful as a probe or primer for nucleic acid hybridisation, and in the design and proteins in tunour cells. An amplified portion of tunour polynuclectide is useful for isolating a full length excended or ibrary. The present sequence is a cDNA (full length gene from a suitable planary. The present sequence is a cDNA (full length excended or conformatial) isolated from a library derived from lung tunour/cancer cells. Sequence data for this patent did not form part of the printed conformatial in eaguence. The present did not form part of the printed conformatial in electronic format directly from the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TTGTTGACTATGAGGAAGTTCTAGGAAACTAGGAATCTATGATGCTGATGGTGATGGAG 300

The invention describes an isolated polynucleotide comprising one of 32 sequences, complement or degenerate variants of them. The polynucleotide is useful for preparing a composition e.g. a vaccine or for gene therapy, for treating or inhibiting development of cancer, e.g. lung cancer. This sequence represents a polynucleotide associated with the compositions and methods for the therapy and diagnosis of lung cancer

The invention relates to novel compositions and methods for the therapy and diagnosis of cancer, particularly lung cancer. The compositions comprise one or more lung tumour polypeptides, immunogenic portions thereof, polynocleorides that encode such polypeptides, antigen presenting cells that express such polypeptides, and T cells that are specific for cells expressing such polypeptides. The novel compositions have cycostatic and immunostimulant activity. The lung tumour antigens can be used in the creation of a vaccine. The polynucleotides that encode the lung tumour polypeptides can be used in gene therapy to help in the treatment of lung tumours. This polynucleotide sequence represents a treatment of lung tumours. This polynucleotide sequence represents a human lung tumour cDNA clone of the invention. This sequence was not human lung tumour cDNA clone of the invention. This sequence was not broperty Organization CD ROM supplied with the specification.

RESULT 13

```
The invention relates to a novel isolated polynucleotide comprising a sequence chosen from any one of 40 lung tumour polypeptides or its complements, fragments or degenerate variants. The method of the invention has cytostatic applications and may be useful for detecting and treating lung cancer in a patient, as well as for inhibiting the development of lung cancer in a patient via incubating Cut+ and/or CD8+ rolls isolated from a patient with at least one component chosen from a polypeptide, polynucleotide or antigen presenting cell (AFC) of the invention and administering an effective amount of the proliferated T cells to the patient. The current sequence is that of the human lung cancer-related CDNA of the invention. The current sequence is not shown in the specification per se but is available on the USPTO web-site http:seqdata.uspto.gov/sequence.html?DocID=20030211510.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    65 GGTITATGGTGATTGCTGGGGCGTCTGGACATCTGTAGCTTGGTTTGATC 124

```

The present invention relates to the isolation of human protein modification and maintenance molecules (PMMM), and the polymucleotide sequences encoding them. A total of 40 PMMM polypeptides (designated PMMM -1 to PMMM-40) are disclosed. The sequences of the invention are useful for diagnosing a condition or disease associated with the expression of PMMM in a subject, preparing a polyclonal or monoclonal antibody, and

generating an expression profile of a sample containing the polynucleotides. The diseases or conditions associated with decreased expression or overexpression of Phym are cell proliferation disorders (e.g. cancer, atheroscletosis), neurological disorders (e.g. epilepsy, Huntington's disease, stroke), immune/inflammatory disorders, (e.g. AIDS, allergies), developmental disorders (e.g. hypothyroidism, Cushing's allergies), gastrointestinal or epithelial disorders, and infections. The Phym polypeptides or their fragments are useful in screening compounds for effectiveness as agonists or antagonists of the polypeptides, or in altering the expression of the target polynucleotide and compounds specifically bind to, or modulate the activity of the polypeptide. ACA92416-ACA92455 encode the human PWMM polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GATAGATTTGAGACCCTGGAACCTGAAGTATCTCATGAAGAAACCGAGCATAGTTACCAC

This clone was selected for full length sequencing because it
passed the following selection criteria: matched mRNA gi: 14589865
This clone has the following problem: The cds is short compared to
the longest cds in the locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GCTCCGGCAGCGGTAGCACGAGTGCGGGCAGCAGCAGCCCCGGGGCCCCGGAGAGACAA 120

Center clone name: 23 M 4

Sequencing vector: M13; M77815; 3% of reads
Sequencing vector: Plasmid; n/a; 97% of reads
Sequencing vector: Plasmid; n/a; 97% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.96071

Consensus quality: 132571 bases at least Q40

Consensus quality: 132753 bases at least Q20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Smit, A.F.A. & Green, P. This family includes the N-terminal regions of the junctin, junctate and aspartyl beta-hydroxylase proteins. Junctate is an integral BR/SR membrane calcium binding protein, which comes from an alternatively spliced form of the same gene that generates aspartyl beta-hydroxylase and junctin. Aspartyl beta-hydroxylase the post-translational hydroxylation of aspartic acid or asparagine residues contained within epidermal growth factor (BGF) domains of

are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.
